What Are These Demos About?	xi
How to Use These Demos	xii
If This Is Your First Time Using Fathom	xv
Tutorial: An Extended Example	xv
A Few Good Skills	xix
Fathom Overview	xxi
Measures of Center and Spread	1
Demo 1: The Meaning of Mean	2
<i>The mean • How individual values affect the mean</i>	
Demo 2: Mean and Median	4
<i>Measures of center: mean, median, and midrange • Resistance: what happens to the measures when you move one point</i>	
Demo 3: What Do Normal Data Look Like?	6
<i>Normally distributed data • The effect of changing the mean and standard deviation</i>	
Demo 4: Transforming the Mean and Standard Deviation	8
<i>What happens to the mean and standard deviation when you add a constant to every value or multiply every value by a constant</i>	
Demo 5: The Mean Is Least Squares, Too	10
<i>Defining the mean as the place where the sum of squares of deviations is a minimum (just like the least-squares line) • The median, and what it minimizes</i>	
Regression and Correlation	13
Demo 6: Least-Squares Linear Regression	14
<i>Exploring the squares in least squares • Minimizing the areas of the squares built on residuals</i>	
Demo 7: Standard Scores	16
<i>Using standard scores to compare unlike scales • Making a scale in terms of standard deviations</i>	
Demo 8: Devising the Correlation Coefficient	18
<i>How the correlation coefficient measures what it does</i>	

Demo 9: Correlation Coefficients of Samples	21
<i>How samples from a correlated population yield different values for the correlation • How sample size affects that sampling distribution</i>	
Demo 10: Regression Toward the Mean	24
<i>Regression toward the mean • The meaning—and asymmetry—of the least-squares line</i>	
Random Walks and the Binomial Distribution	27
Demo 11: Flipping Coins—the Law of Large Numbers	28
<i>How the proportion of heads approaches 0.5 as sample size increases • How the number of heads does not approach half the sample size</i>	
Demo 12: How Random Walks Go as Root N	31
<i>How the distance from the origin increases with the number of steps</i>	
Demo 13: Building the Binomial Distribution	36
<i>Constructing the binomial distribution by resampling • How the distribution depends on the population proportion</i>	
Demo 14: More Binomial	39
<i>How the binomial distribution depends on sample size for small N • The relationship between the distribution of sample proportions and the distribution of sample counts</i>	
Demo 15: Two-Dimensional Random Walks	41
<i>Unexpected behavior in 2D random walks • How the 2D walk eventually looks like a 2D normal distribution</i>	
Standard Deviation, Standard Error, and Student's t	45
Demo 16: Standard Error and Standard Deviation	46
<i>Getting a feel for the difference between standard deviation and standard error</i>	
Demo 17: What Is Standard Error, Really?	48
<i>The connection between standard error and the sampling distribution of the mean • How the sample size connects standard deviation and standard error</i>	
Demo 18: The Road to Student's t	51
<i>Using standard error as the scale for measuring how far a sample mean is from the true mean • How these quantities are not normally distributed; in fact they follow a t-distribution</i>	
Demo 19: A Close Look at the t-Statistic	55
<i>How sample mean, standard deviation, t, and P interrelate • How they depend on the values of individual points in a sample</i>	
Sampling Distributions	59
Demo 20: The Distribution of Sample Proportions	60
<i>How sample size and population proportion affect the distribution</i>	

Demo 21: Adding Uniform Random Variables	61
<i>What happens when you add two uniform random variables • How that corresponds to adding two dice</i>	
Demo 22: How Errors Add	63
<i>Basic error analysis • How to find the error in the sum of two quantities that each have some measurement error</i>	
Demo 23: Sampling Distributions and Sample Size	65
<i>How sampling distributions (of the mean) get narrower as you increase sample size</i>	
Demo 24: How the Width of the Sampling Distribution Depends on N	68
<i>How the width (as measured by IQR) of a sampling distribution of the mean is inversely proportional to the square root of the sample size</i>	
Demo 25: Does $n - 1$ Really Work in the SD?	71
<i>Unbiased estimators • How the familiar formula for sample standard deviation is not unbiased • Why we should care about variance</i>	
Demo 26: German Tanks	73
<i>Unbiased estimators • Evaluating estimators from their sampling distributions • Even among unbiased estimators, some are better than others</i>	
Demo 27: The Central Limit Theorem	76
<i>A demo of the CLT • How sampling distributions usually look normal • Cases where they do not look normal</i>	
Confidence Intervals	79
Demo 28: The Confidence Interval of a Proportion	80
<i>Defining the confidence interval • Looking at sample results in terms of plausibility</i>	
Demo 29: Capturing with Confidence Intervals	83
<i>How confidence intervals of a proportion do not always capture the population value</i>	
Demo 30: Where Does That Root ($p(1 - p)$) Come From?	85
<i>The standard deviation of a variable that's only 0 or 1 • Connecting the "proportion" situation to the "mean" situation</i>	
Demo 31: Why $np > 10$ Is a Good Rule of Thumb	87
<i>Explaining the $np > 10$ rule for using the normal approximation in the CI of a proportion</i>	
Demo 32: How the Width of the CI Depends on N	90
<i>How the width of a confidence interval is inversely proportional to the square root of the sample size</i>	
Demo 33: Using the Bootstrap to Estimate a Parameter	93
<i>The bootstrap • Using resampling (with replacement) to create an interval for a parameter</i>	

Demo 34: Exploring the Confidence Interval of the Mean	96
<i>How the CI depends on individual values</i>	
Demo 35: Capturing the Mean with Confidence Intervals	98
<i>How confidence intervals of a mean do not always capture the population value • What repeated CIs look like</i>	
Hypothesis Tests	101
Demo 36: Fair and Unfair Dice	102
<i>Creating a measure of “fairness” • Sampling distributions • Testing hypotheses empirically • The chi-square statistic</i>	
Demo 37: Scrambling to Compare Means	106
<i>Randomization test • Using scrambling to simulate the null hypothesis • Generating a sampling distribution</i>	
Demo 38: Using a t-Test to Compare Means	109
<i>Comparing means with Student’s t</i>	
Demo 39: Another Look at a t-Test	111
<i>Repeated t-tests on samples from the same distribution • How t, P, mean, and standard deviation interrelate</i>	
Demo 40: On the Equivalence of Tests and Estimates	113
<i>How a hypothesis test and a confidence interval are really the same</i>	
Demo 41: Paired Versus Unpaired	115
<i>How a paired test gives a significant result more easily than its unpaired counterpart</i>	
Demo 42: Analysis of Variance	117
<i>Assessing whether means are different in different groups • Introduction to ANOVA</i>	
Power in Tests	121
Demo 43: The Distribution of P-Values	122
<i>How the distribution of P is flat if the null hypothesis is true • How it changes if the null hypothesis is false</i>	
Demo 44: Power	124
<i>How power—the chance that you reject the null hypothesis—changes with the population parameters</i>	
Demo 45: Power and Sample Size	127
<i>How power—the chance that you reject the null hypothesis—changes with sample size</i>	

Demo 46: Heteroscedasticity and Its Consequences	129
<i>Homoscedasticity—an assumption behind many statistical calculations • What happens when that assumption is not met</i>	
Distributions	133
Demo 47: Wait Time and the Geometric Distribution	134
<i>The distribution of times until something happens • How this is the geometric distribution</i>	
Demo 48: The Exponential and Poisson Distributions	137
<i>The continuous analog to the geometric distribution • How many events happen in a given period: a Poisson distribution</i>	
Demo 49: Sampling Without Replacement and the Hypergeometric Distribution	140
<i>How distributions change when the sample is large compared to the population</i>	
Demo 50: The Bizarre Cauchy Distribution	143
<i>The Cauchy distribution • The meaning of mean and standard deviation; how it's possible for a distribution to have neither</i>	
Appendix A: How Did They Do That?	145
Appendix B: A Little Mathematical Statistics	151
Some Basics	151
The Distribution of the Sample Mean	154
A Random Walk: Two Proofs That the Mean Square Distance Is N	155
How to Generate Correlated Data	157
Sample Variance: Why the Denominator Is $n - 1$	158
The Geometric Distribution: Proof That the Mean Is $(1/p)$	160
Generating Normally Distributed Random Numbers	162
Selected Solutions	163
